PENNSYLVANIA COMPENSATION RATING BUREAU

Retrospective Test of Trend Projections for Loss Ratios

Attached is a retrospective test of the predictive accuracy of various trend procedures.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations of from four to ten data points, which permitted a test of the projected loss ratio three years hence, were used. Our current review trends policy year 2006 3.25 years, policy year 2005 4.25 years, and policy year 2004 5.25 years. An average of those three values is then calculated.

Current estimates of policy year ultimate loss (to expected loss) ratios are compared with predicted values based on trending through earlier years. The results are shown for three loss development approaches: incurred, paid to twentieth and the average of the incurred and the paid to twentieth methods.

As an illustration, the incurred loss development approach generated an indemnity loss ratio of 0.5404 for policy year 2001. Fitting the loss ratios for policy years 1995 to 1998 using a straight line and projecting that to 2001 yielded a loss ratio of 0.3964, which understates our current estimate for 2001 by 0.1440 points.

Please note that the boxed numbers correspond to those numbers that do not have a comparable value in Exhibit 11b, Retrospective Test of Trend Projections for Severity Ratios.

Indemnity
Actual Ultimate Loss Ratios
Including Average of Paid and Incurred

INDEMNITY	Loss Ratio	Loss	Loss
